

Coding Agent Platform Take Home Assignment

Overview

Build an enterprise-ready coding agent platform using Pydantic AI, Slack, Temporal, AWS EKS, Kubernetes, and Terraform.

Objective

Create a Slack-based coding assistant that receives requests, coordinates tasks through Temporal workflows, and integrates with GitHub. The system should support concurrent users with privacy and session isolation.

Reference architecture. You may improve or redesign this flow.

Time Expectation

Please spend no more than two days. We value design quality, security, and clear documentation over completeness.

Submission Deadline

Monday, 7:00 AM PDT

Please Submit

- A GitHub repository link OR a ZIP file of the project
- README with install, deploy, run, and cleanup steps
- Short design notes covering decisions, limitations, and future improvements
- Architecture diagram

Required Stack

- Pydantic AI for agent implementation
- Slack App created in a free Slack workspace

- Temporal for orchestration and workflow state
- AWS EKS for Kubernetes deployment
- Terraform for AWS infrastructure
- Helm for Kubernetes packaging
- GitHub integration or clearly documented mock implementation
